If minimum maintained system pressure is not known: Default to 40% of design head *The IVS 102 drive is a low harmonic drive via built-in DC line reactors. This does not guaranty performance to any system wide harmonic specification or the costs to mee a system wide specification. If supplied with the system electrical details, Armstrong will run a computer simulation of the system wide harmonics. If system harmonic levels are exceeded Armstrong can also recommend additional harmonic mitigation and the costs for such mitigation.

Performance curves are for reference only.

Confirm current performance data with Armstrong ACE Online selection software.
